Mismatch between jobs and skills in the EU

JOCLAD 2017

DMSI-ME / Joao S. Lopes

(21-04-2017)

Motivation

- "Skills development are essential in the emerging new economy and fast-changing labour market"[1]
- "Qualification and skill mismatches entail significant economic and social costs for individuals and firms"[1]
- Skills mismatch (i.e. over-qualification, under-qualification) remains at 45% (CEDEFOP, 2015)[2]
- EU Guidelines (2015) call for enhancing labour supply, skills and competences[3]

Motivation

Create framework that:

1. combines **Official Statistics** with **Big Data**

2. estimates **Labour Market Attractiveness** and its association with **Skills Mismatch**, Labour Market Mobility and Emigration

3. is aimed at **policy makers** and both **jobseekers** and **job providers**

Data: LMkt Attractiveness

- “reg_dem” – demographic statistics
- “earn” – earning structure
- “educ_uoe_fin” – public expenditure on education
- “ilc” – income and life conditions
- “employ” – employment statistics
- “nama10” – annual national accounts
- “educ_part” – participation in education

7 datasets, **17** main variables

Data: LMkt Attractiveness

- "reg_dem" by **age** (**NUTS2**)
- "earn" by **occupation** and **economic activity**
- "educ_uoe_fin"
- "ilc" (**NUTS2**)
- "employ" by **age**, **education level**, **economic activity** (**NUTS2**)
- "nama10" (**NUTS2**)
- "educ_part" (**NUTS2**)

7 datasets, **17** main variables, **76** variables

subjects: **NUTS0 = 28**; NUTS1= 98; NUTS2 = 276.

Data: Skills mismatch

- "EURES" **scrapped data** on jobseekers' CVs
- "EURES" **scrapped data** on job vacations

2 datasets, **1** main variable

... but

cleaning and **structuring** requires considerable expertise

normalization requires detailed demographical information

Data: Skills mismatch

- “educ_uoe_grad02” – education statistics
- “jvs_a_nace2” – job vacancy statistics

2 datasets, **1** main variable

Data: Skills mismatch

- "educ_uoe_grad02" by **education field**
- "jvs_a_nace2" by **occupation** and **economic activity** (**NUTS2**)

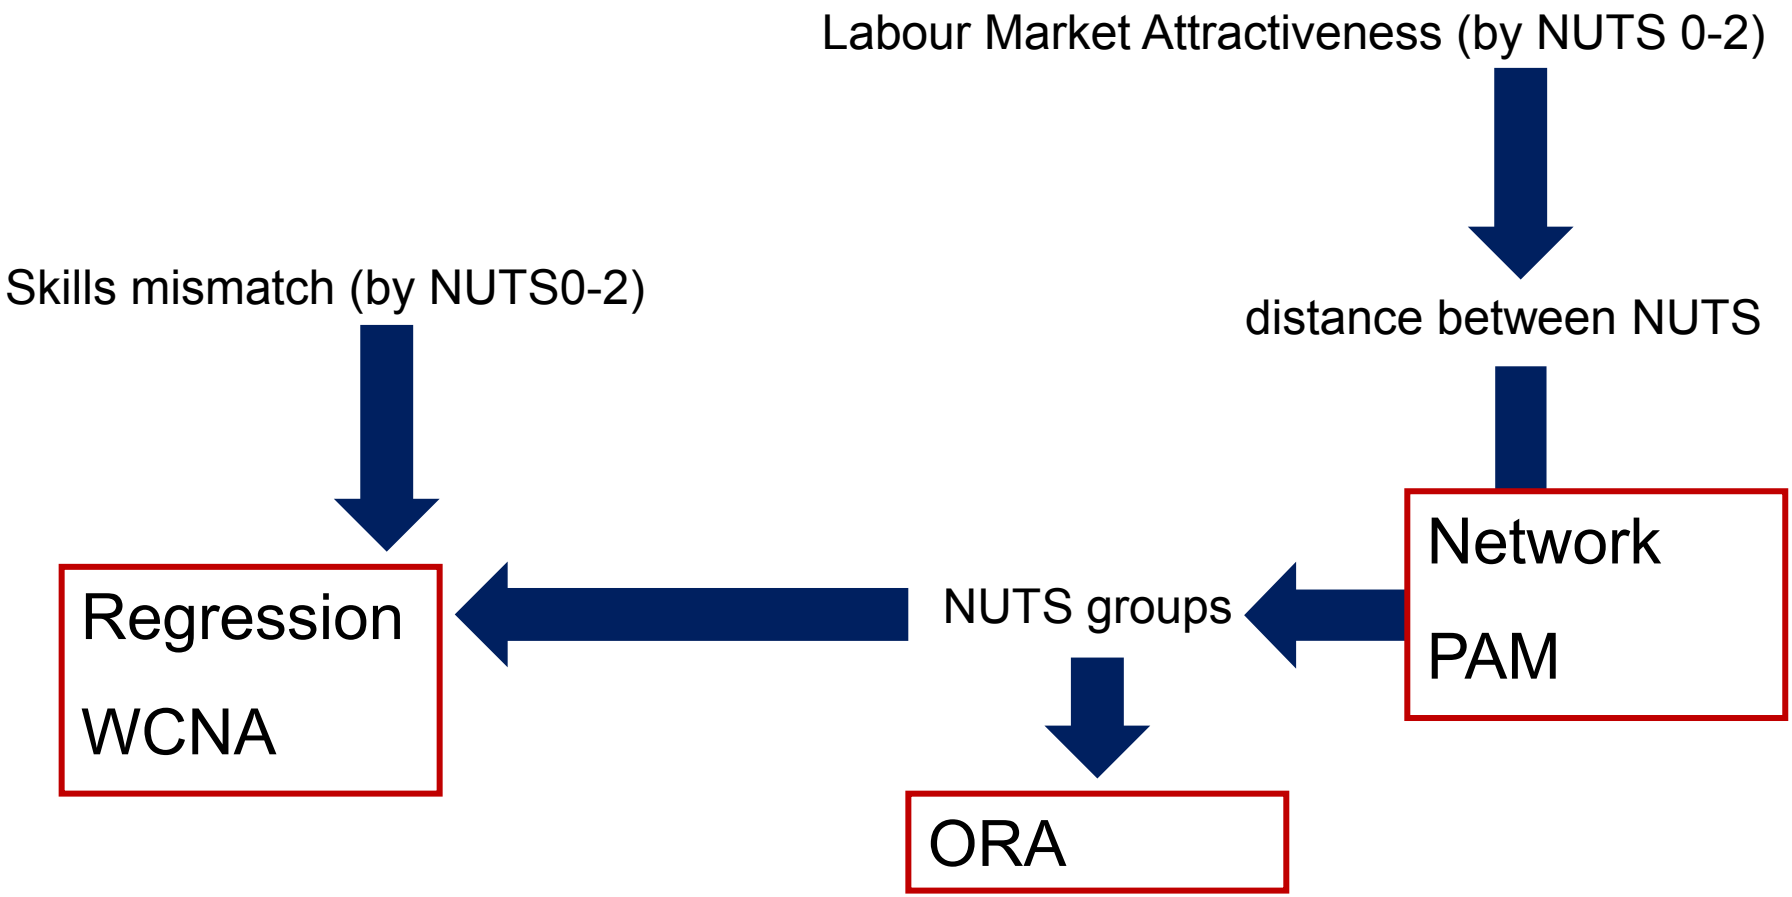
2 datasets, **1** main variable, **1** variable

subjects: **NUTS0 = 8**; NUTS1= 14; NUTS2 = 47

Methods

- Network Analysis
- Partition-around-medoids (PAM)[4]
- Over-representation analysis (ORA)
- Multinomial regression
- Multivariate regression
- Weighted correlation network analysis (WCNA)[5]

Methods



Labour Market Attractiveness (by NUTS 0-2)
distance between NUTS
Network
PAM
NUTS groups
ORA
Skills mismatch (by NUTS0-2)
Regression
WCNA

labels	description	mismatch	EU_groups
MEblack	Unemployment		
MEgreen	Poverty		**0.63**
MEred	Industry sector		
MEyellow	emp_Y25-64_ED0-4	**-0.50**	
MEturquoise	Earnings		**0.80**
MEblue	emp_Y15-24_ED5-8		**0.63**
MEbrown	emp_Y15-24_ED3-4	**-0.86**	**0.57**

Conclusions

- **LMkt Attract** is able to form consistent clusters at NUTS0
- **Youth unemployment** and **GDP** can separate well clusters
- **LMkt Attract** can be separate in different modules: **Unemployment**, **Poverty**, **Industry**, **emp_Y25-64_ED0-4**, **Earnings**, **emp_Y15-24_ED3-4** and **emp_Y15-24_ED5-8**
- **Skills Mismatch** is associated with **population Y15-24**, negative association with **Pop_{prop}**, **Emp_{prop}** and **$NaceM\_N_{prop}$**
- **Skills Mismatch** is strongly associated to module **emp_15-24_ED3-4**

Methods: details

- Network Analysis

  distance: weighted Euclidean distance

  transformation: min-max transformation

  edge threshold = {0.65, 0.8, 0.9}

  algorithm: “Fruchterman–Reingold” algorithm

- Partition-around-medoids (PAM)

  distance: weighted Euclidean distance

  k-best = max(average silhouette width), when k != 2

- Over-representation analysis (ORA)

  num2cat: $x \in P_{[0.00\text{-}33.33]}$ and $x \in P_{[66.66\text{-}100.00]}$

  p-value correction: none

  p-value cut-off = 0.10

Methods: details

- Multinomial regression

remove NAs: column-wise (NA > 0.00) and row-wise (NA > 0.00)

remove predictors: i) r-between < 0.90; ii) r-within < [up-to 30 vars]

transformation: min-max transformation

max terms: hard threshold (i.e. nvars = nsubj – 1)

confidence set = 100

model level: only main effects

information criteria: AIC

models exploration: if nmods < 200000 exhaustive screening, else genetic algorithm

genetic algorithm: i) popsize = 100, mutrate = 10^{-3}, sexrate = 0.1, imm = 0.3, deltaM = 0.05, deltaB = 0.05, conseq = 5; ii) popsize = 200, mutrate = 10^{-2}, sexrate = 0.2, imm = 0.6, deltaM = 0.005, deltaB = 0.005, conseq = 10. Number replicates = 2.

model: multinomial log-linear model via single-layer feed-forward neural networks

Methods: details

- Multivariate regression

remove NAs: column-wise (NA > 0.00) and row-wise (NA > 0.00)

remove predictors: i) r-between < 0.90; ii) r-within < [up-to 30 vars]

transformation: min-max transformation

max terms: hard threshold (i.e. nvars = nsubj – 3)

confidence set = 100

model level: only main effects

information criteria: AICc

models exploration: if nmods < 200000 exhaustive screening, else genetic algorithm

genetic algorithm: i) popsize = 100, mutrate = 10^{-3}, sexrate = 0.1, imm = 0.3, deltaM = 0.05, deltaB = 0.05, conseq = 5; ii) popsize = 200, mutrate = 10^{-2}, sexrate = 0.2, imm = 0.6, deltaM = 0.005, deltaB = 0.005, conseq = 10. Number replicates = 2.

model: multivariate linear regression

Methods: details

- Weighted correlation network analysis (WCNA)

  remove NAs: row-wise (NAs > 0.50) and col-wise (NAs > 0.15)

  distance = Topological Overlap Matrix(|Spearman $r|^k$)

  k-power transformation: k = min(k), when k > 0.7*k-best

  minimum module size = 2

  cluster splitting level = 4, where level ϵ {1,2,3,4}

  dynamic tree cut method = “hybrid”

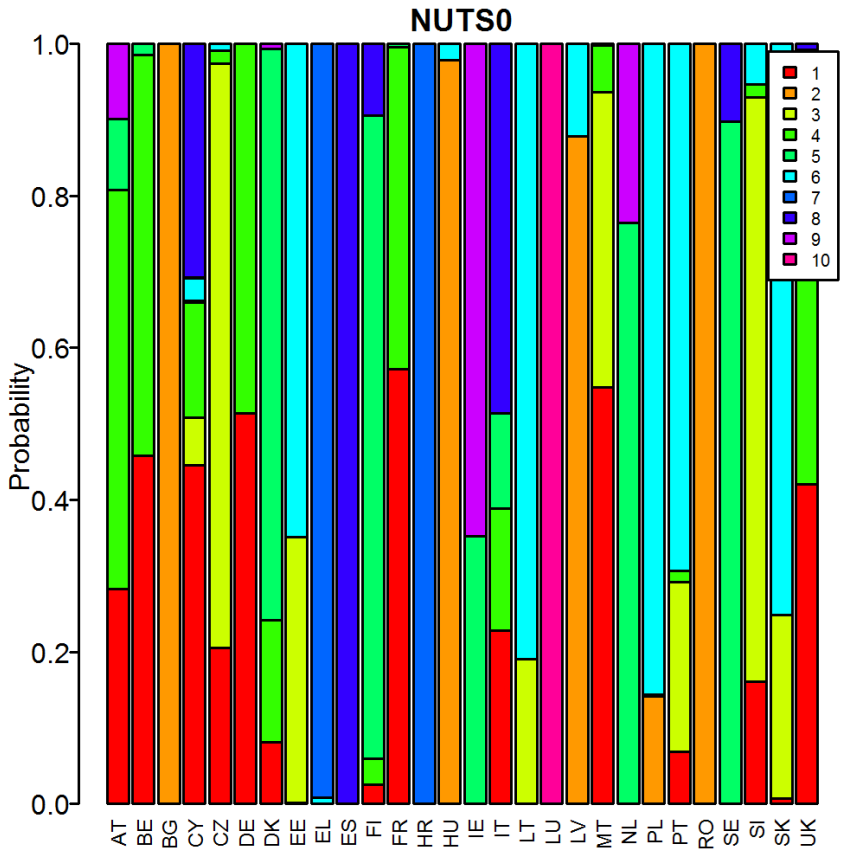
  merge cut-off height = 0.05

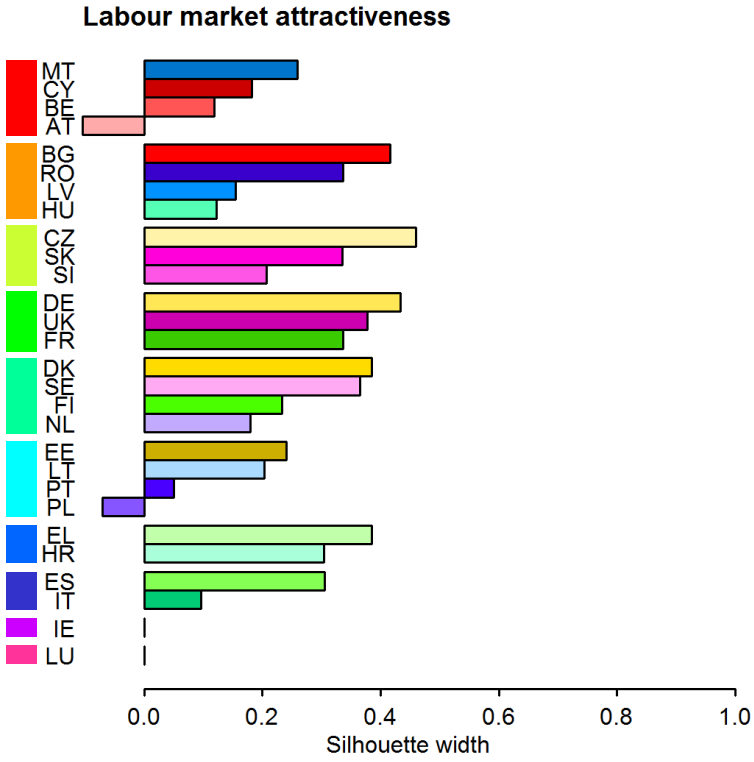
  distance between modules = 1 - |Spearman r (eigenvalues)|

  association modules and variables: i) Spearman r (eigenvalues) for numeric variables; ii) (R’s McFadden)^{½} for categorical variables

  p-value cut-off = 0.01

Results: LMkt Attractiveness





EU_groups ~ 1 + unemp_Y15-24 + GDP
